

Introduction	3	Examples of distance and stability	31
Control systems and design	3	Controller design for robust stabilization	32
Overview	3		
PART I: BASIC PRINCIPLES	5		
Control theory dynamics	5	Tracking	33
Transfer functions and state space	5	Varying input frequencies	34
Nonlinearity and other problems	7	Stability margins	35
Exponential decay and oscillations	7	State feedback	35
Frequency, gain and phase	8	Regulation example	36
Bode plots of gain and phase	9	Tracking example	38
Basic control architecture	10	PART III: COMMON CHALLENGES	40
Open loop control	10	Nonlinearity	40
Feedback control	12	Linear approximation	40
Proportional, integral and derivative control	13	Regulation	41
Sensitivities and design tradeoffs	15	Piecewise linear analysis and gain scheduling	42
PID design example	15	Feedback linearization	42
Output response to step input	16	Adaptive control	43
Error response to noise and disturbance	17	General model	44
Output response to fluctuating input	17	Example of nonlinear process dynamics	45
Insights from Bode gain and phase plots	18	Unknown process dynamics	45
Sensitivities in Bode gain plots	19	Model predictive control	45
Performance and robustness measures	20	Tracking a chaotic reference	46
Performance and cost: J	21	Quick calculation heuristics	47
Performance metrics: energy and \mathcal{H}_2	21	Mixed feedforward and feedback	48
Technical aspects of energy and \mathcal{H}_2 norms	22	Nonlinearity or unknown parameters	48
Robustness and stability: \mathcal{H}_∞	22	Time delays	48
PART II: DESIGN TRADEOFFS	23	Background	48
Regulation	23	Sensor delay	48
Cost function	23	Process delay	49
Optimization method	25	Delays destabilize simple exponential decay	50
Resonance peak example	25	Smith predictor	51
Frequency weighting	26	Derivation of the Smith predictor	52
Stabilization	28	Summary	52
Small gain theorem	29	Feedback	52
Uncertainty: distance between systems	30	Robust control	53
Robust stability and robust performance	31	Design tradeoffs and optimization	53
		Future directions	53
		References	54
